

Performing a download in Paragon Desktop will allow users to update their Paragon Desktop database with all the recently inputted, modified, or removed listings from the online system. The online system has to prepare listings for downloads. If you were to make a change to an online listing or you uploaded listing(s) and you wanted these changes to be reflected in your Desktop, you should wait 15 minutes before performing the download. This gives Paragon 4 time to prepare those listings to be downloaded back to Desktop.

From the homepage in Desktop select the **Download** icon.

It is recommended that you do a download several times a day. You can schedule Paragon Desktop to automatically download for you even when you are away from your computer. See the User Preferences guide for instructions to set this up.

A window will pop up asking if you want to continue with the download. Click on the **Yes** button to continue.

The Paragon Desktop window will close briefly and launch the Load Status module that will begin to download updated information for Paragon Desktop. Then Paragon window will reopen with a message stating: The download has completed successfully. Click **OK**
