

Synchronization allows Paragon Desktop users to sync any saved searches, contacts/prospects, field preferences, and E-mails with Paragon Online System and vice versa. Any saved search created in Paragon Desktop can be sync'd so that the same saved search can be used in the Online system. The synchronization works both ways. If a user were to create a new prospect within the Online system the same user could use the Synchronization option to download the Prospect into Desktop.

You must be connected to the internet when you run Synchronize User Data. On the right side of the screen select Synchronize.

The connection is made immediately and the synchronization process begins. Uploading or downloading listings is not done by this process.

The contacts, email, field preferences, auto-emails and saved searches are being synchronized.

When the synchronization has completed successfully this screen displays.

Click **OK** to close.
